

## Desired Outcomes

- Student understands Excel workbooks and worksheets
- Student can navigate in an Excel workbook and worksheet
- Student can use toolbars and icons in Excel
- Student understands
  - values
  - formats
  - formulas
  - absolute and relative cell referencing
  - built-in functions
  - order of operations
- Student can create a basic spreadsheet
- Student can print a spreadsheet or part of a spreadsheet

## Excel

Microsoft Excel is an application program called an electronic spreadsheet. Electronic spreadsheet programs allow you to organize data, perform calculations, make decisions, and present your data in a table or graph. When Excel starts it opens a document window called a workbook. A workbook is based on a template. A workbook is composed of worksheets. Each worksheet has 256 columns running vertically and intersecting to form **cells** with 16,384 rows running horizontally. Cells are referred to by their column heading and their row number. In Figure 12-1 the active cell is B6. Values are placed in cells as text, numbers, or formulas.

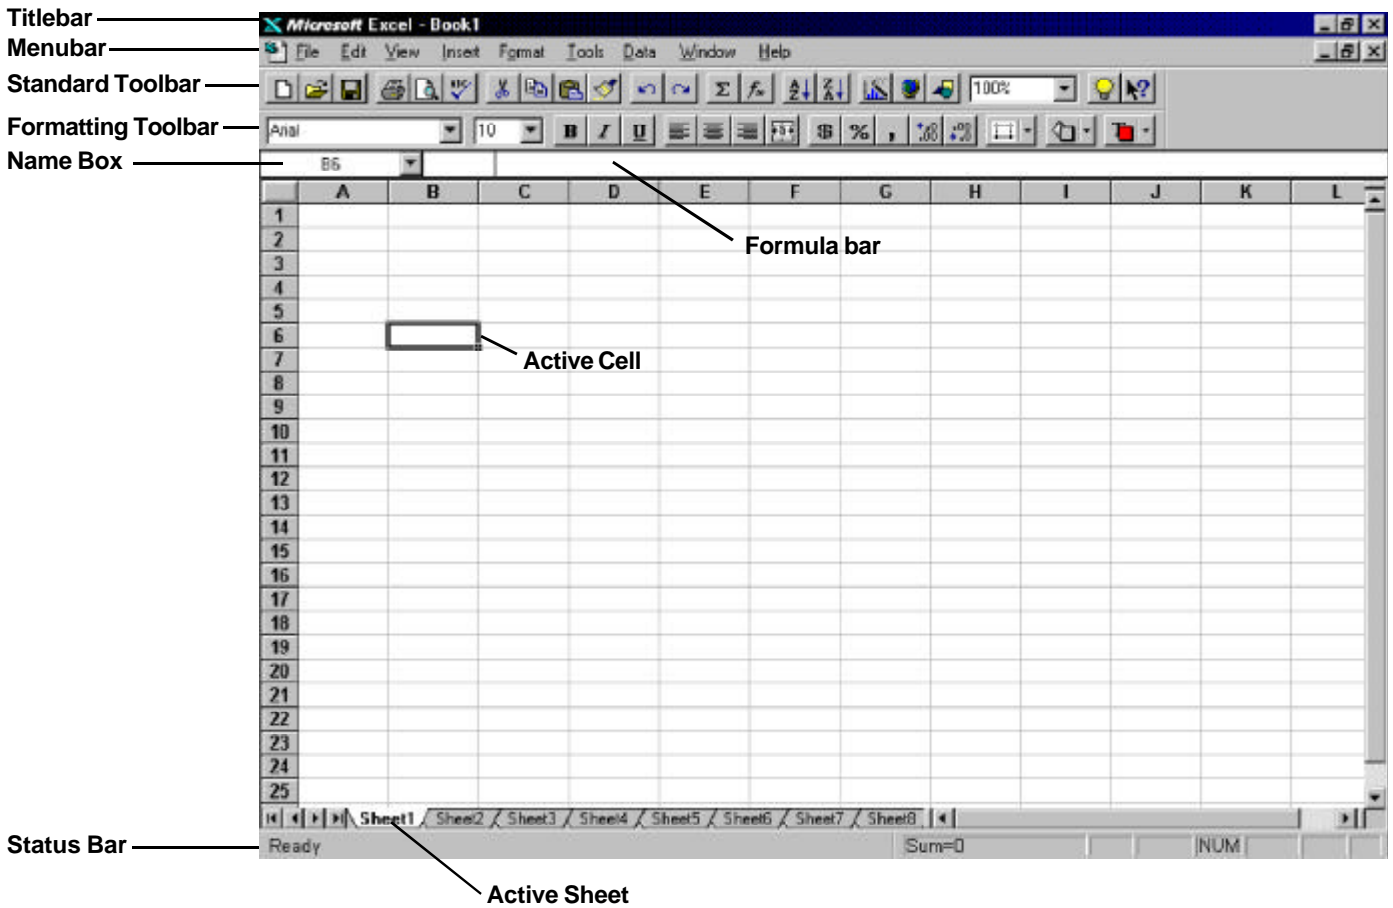

Figure 12-1. Microsoft Excel screen.

### Selecting a Cell

To enter data into a cell, you first must select it. The easiest way to select a cell (make it active) is to use the mouse to move the block plus sign to the cell and click.

## Navigating in a Worksheet Using the Keyboard

Arrow Keys	move one cell in the direction of the arrow
Page Up/Down	scrolls one screen up or down
Ctrl + Home	move to the top left cell
Ctrl + End	move to the bottom right cell of the worksheet
Ctrl + Tab	cycles through workbooks
Ctrl + Page Up/Down	flips through worksheets

## Selecting a Range of Cells

To select a range of cells click on the first cell in the range and drag to the last cell in the range and release the left mouse button.

- Hold down the Shift key and move with the arrows.
- Use the Ctrl key to simultaneously select cells that are not contiguous.
- Click on row or column heading to select the entire row or column.

	A	B	C	D	E	F	G	H

Figure 12-3. Selecting cells in a worksheet.

## Entering and Editing Data

### Entering Data

1. Click on the cell where you want to enter a value.
2. Type in the value.
3. Press the Enter key. Press the Esc key to cancel the entry.

## Editing Data

Double-click on a cell.

Select a cell and press “F2”.

Click in the Cell Content Bar.

## Delete

Excel stores both the value entered into a cell and the formatting assigned to the cell.

### To delete the cells formatting:

Click on the Edit menu, point to Clear, point to Formats, and click on it.

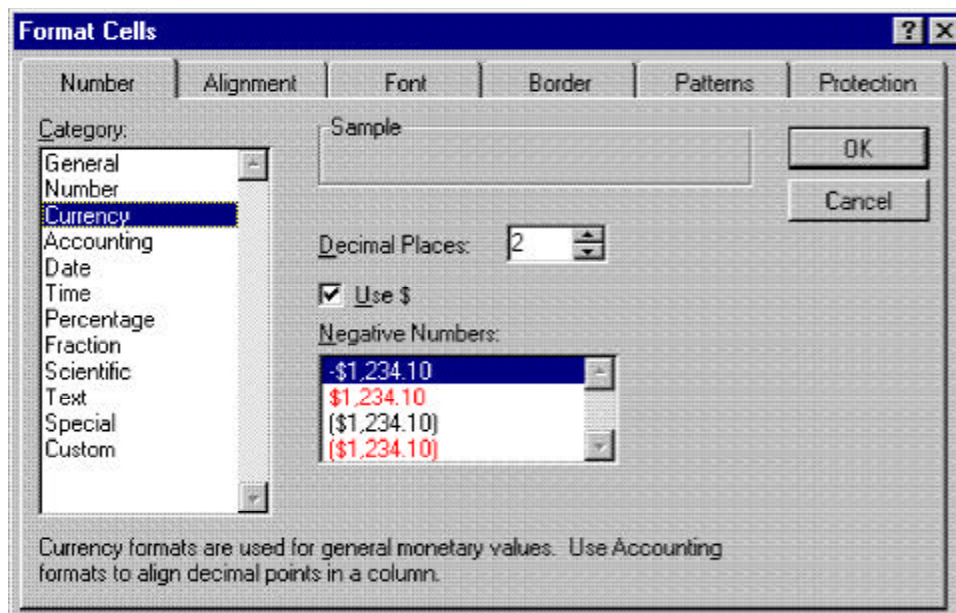

### To delete the contents on a cell :

Select the cell and press the delete key. Cells store contents separately from cell formats. Using the delete key will only delete the cells content and not the cell format.

## Formatting

Click in the cell you want to format to make it the active cell.

Click on the Format menu and click on the Cells command.

**Figure 12-4.** Format Cells dialog box.

Excel has several options for formatting a cell. If a cell has been formatted for currency it will display according to the style of currency format selected. Formatting cells provides consistency for displaying the same type of data in a spreadsheet. It can also save you time when entering values into a cell, for example, the currency style automatically places a dollar sign symbol in front of the number being entered into the cell.

## Formulas

The power of an electronic spreadsheet is utilized by the use of formulas. Without formulas a spreadsheet is just a grid with numbers entered in it.

### Basic Formula Structure

All formulas start with the symbol “ = ”.

Example:

Type the following values into a worksheet:

Cell A1: 5

Cell B1: 6

Cell C1: =A1 + B1

	A	B	C	D
1	5	6	11	
2				
3				
4				

Notice that cell C1 displays the result of adding cell A1 to cell B1. The formula displays in the formula bar.

### Order of Operations:

1. Items in parentheses ( )
2. Exponents, ^
3. Multiplication, \* and Division, /
4. Addition, + and Subtraction, -

= 5 + 10 \* 4

= (5 + 10) \* 4

Use the sample spreadsheet shown in Figure 12-5 to practice with order of operations. To toggle between a value spreadsheet and a formula spreadsheet use the keyboard combination Ctrl + ` . The ` key is on the top row to the left of the 1 key.

	A	B	C	D
1	3	2	5	=A1+B1+C1
2	7	7	6	=A3*B2-C3
3	5	3	9	=2*(B3+C1)
4	=A2^B1	=20/(A3+C1)	=A1	=A2^B3-C3*B2
5				

Figure 12-5. Practice spreadsheet.

## Copying Formulas

When you copy a formula, cell references adjust.

Row numbers change when the formula is copied or moved up or down the rows.

	A	B	C
1	12	6	=A1+B1
2	10	9	=A2+B2
3	10	-5	=A3+B3

Column letters change when the formula is copied or moved across columns.

	A	B	C
1	12	6	10
2	10	9	-5
3	=A1+A2	=B1+B2	=C1+C2

## Absolute vs. Relative

References that adjust as described above are called relative. You can make an absolute reference that does not change. Simply place a \$ character in front of any reference that should not adjust.

	A	B	C
1	tax rate	1.0725	
2	Price	Shipping	Total
3	12	2	=(A3+B3)*\$B\$1
4	25	4	=(A4+B4)*\$B\$1
5	50	6	=(A5+B5)*\$B\$1
6	75	8	=(A6+B6)*\$B\$1

Formula Worksheet

	A	B	C
1	tax rate	1.0725	
2	Price	Shipping	Total
3	12	2	\$ 15.02
4	25	4	\$ 31.10
5	50	6	\$ 60.06
6	75	8	\$ 89.02

Value Worksheet

## Functions

Functions are common formulas found in business, accounting and math that are built in to Excel.

Functions return a value.

You can use cell references in functions.

	B7	=SUM(B3:B6)		
	<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>
<b>1</b>	<b>Travel Expenses</b>			
<b>2</b>		<b>Austin</b>	<b>SF</b>	
<b>3</b>	Transportation	468		
<b>4</b>	Hotel	180		
<b>5</b>	Food	64		
<b>6</b>	Misc.	10		
<b>7</b>	<b>Total</b>	<b>\$ 722.00</b>		
<b>8</b>				

The SUM() function is used in cell B7.

## Practice Creating a Spreadsheet

In this example you will create a spreadsheet that will calculate the monthly payment for a loan needed to purchase a new computer.

### Procedure

1. Start Excel.
2. Enter the following values into the cells indicated. If you make a mistake, double-click in the cell and change the value.

	<b>A</b>	<b>B</b>	<b>C</b>
<b>1</b>	Computer Loan Spreadsheet		
<b>2</b>			
<b>3</b>			
<b>4</b>	Loan Amount	3500	3500
<b>5</b>	Interest	0.0725	0.18
<b>6</b>	Terms in Months	24	24
<b>7</b>			
<b>8</b>	Monthly Payment	=PMT(B5/12,B6,B4)	=PMT(C5/12,C6,C4)

3. Format the column width so that the value entered displays. A quick way to widen a column width is by right-clicking on the column heading and selecting the Column Width command. Enter a number for the column width that is large enough to see the cells value.

	<b>A</b>	<b>B</b>	<b>C</b>
<b>1</b>	Computer Loan Spreadsheet		
<b>2</b>			
<b>3</b>			
<b>4</b>	Loan Amount	\$3,500.00	\$3,500.00
<b>5</b>	Interest	7.25%	18%
<b>6</b>	Terms in Months	24	24
<b>7</b>			
<b>8</b>	Monthly Payment	(\$157.10)	(\$174.73)

The value worksheet displays the calculated monthly payment. This spreadsheet uses the built-in formula, PMT ().

#### 4. Printing the Spreadsheet

Excel has several options for printing a worksheet. You can print the entire worksheet or a portion of it. To print the value worksheet created in step 3:

- A. Click in cell A1 and hold down the left mouse button while dragging to cell C8. Release the mouse button and the cell range A1:C8 will be highlighted.

	A	B	C	D	E
1	Computer Loan Spreadsheet				
2					
3					
4	Loan Amount	\$3,500.00	\$3,500.00		
5	Interest	7.25%	18%		
6	Terms in Months	24	24		
7					
8	Monthly Payment	(\$157.10)	(\$174.73)		
9					
10					
11					
12					
13					

- B. Click on the File menu and then click on Print. In the Print what section of the Print dialog box select the radio button Selection, then click on OK.
